

PRESS RELEASE

Boxcryptor Announcement: The New Boxcryptor Generation's Technical preview is now available

Boxcryptor – the easy to use encryption solution for Dropbox, Google Drive, Microsoft SkyDrive and many other cloud storage providers – released its New Boxcryptor Technical preview today and will be releasing the official new version this quarter (Q2 2013). With this new version, users will not only have an easy solution to secure their files before uploading them to the cloud without sacrificing safety and comfort, but also now they will be able to securely share access to files and folders without having to share their private passwords with anyone and benefit from other new features.

Augsburg, 09.04.2013: Today Boxcryptor released the technical preview of its new Boxcryptor generation for Windows and Android. This new version has been developed "by taking into consideration the feedback the team has gathered from current and potential users, as well as from the learning we have gained during the last two years" says Robert Freudenreich, founder and CTO of Boxcryptor.

Among many new features, the new Boxcryptor will offer easier and better collaboration options that are extremely important for teams in business environments and for private users who want to share access to files without having to share their private passwords. Moreover, the new version will offer features especially for companies such as the option to set policies or to have a master key in order to access the encrypted information when necessary. Freudenreich emphasizes that Boxcryptor will remain a zero knowledge provider and still will not have access to the user's information or the user's private keys. "Any information we receive from our user is always encrypted and protected by the user's password which is kept secret and never leaves the user's device nor is transferred to anyone", highlighted Freudenreich.

More information about the new Boxcryptor version and where to download the technical preview is available on the <https://www.boxcryptor.com/labs/> site. The Windows preview includes easier access to files (compared to the BoxCryptor 1.x versions), secure sharing of access permissions, and the new group functionality where the user can create groups to share access, and delete or add group members. On Android the technical preview includes basic upload and download functionality for Dropbox and for local storage. The official release of the new Boxcryptor is estimated for this quarter (Q2 2013) and will include all platforms (Windows, Mac OS X, Android, iOS) and Multilanguage.
